

OneLogin Desktop

Move towards a passwordless work environment
and optimize your IT cloud infrastructure

Active Directory (AD) worked well in the past, when everyone used their personal computers in the office and behind the firewall. IT could configure password policies in AD and have them enforced across an entire fleet of PCs. But that scenario has changed.

Today, organization workforces have evolved to work differently. Increasingly, employees use Macs and contractors and employees work remotely. Cloud computing has enabled a more distributed workforce that might not even rely on the corporate network. As a result, a large portion of worker laptops never authenticate against AD. And, often, companies born in the cloud don't even have AD. Either scenarios can mean stale or weak passwords for devices.

ONELOGIN DESKTOP

OneLogin Desktop enables organizations to seamlessly move toward a passwordless environment, while optimizing their cloud infrastructure. It provides **simple** and **secure single sign-on** to apps accessed through OneLogin's portal on both **PCs** and **Macs**. It binds PCs and Macs to OneLogin's cloud directory, ensuring users always authenticate against a live directory, no matter where they are located.

KEY BENEFITS

A cloud directory for cloud apps

Companies that operate in the cloud have AD on the wrong side of the firewall. OneLogin Desktop authenticates laptops against OneLogin's cloud directory, using modern APIs.

Improved SSO experience

Once a user signs into their laptop, they are automatically signed into OneLogin. No need to sign in twice. And fewer passwords to remember means fewer (or no) mistakes.

Reduce TCO

With OneLogin Desktop, you don't need to purchase AD licenses for every device. Save money on AD licenses so you can spend it on other priorities.

Limit access to trusted devices

Using PKI certificates, access to OneLogin portal is restricted to only devices that have OneLogin Desktop installed and are sanctioned by the IT department.

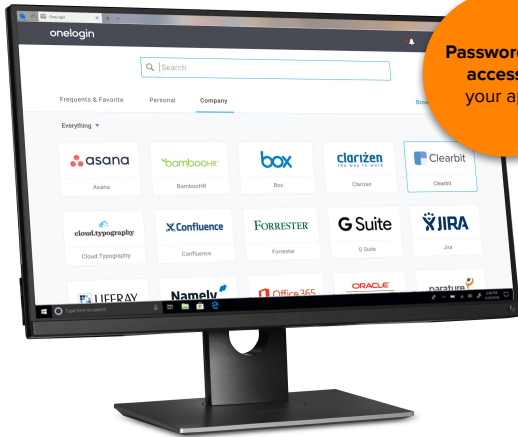

Eliminate dependencies on passwords

Since users sign into their laptops with their OneLogin password, the separate password for the laptop is eliminated, which reduces security exposure.

Kiosk mode

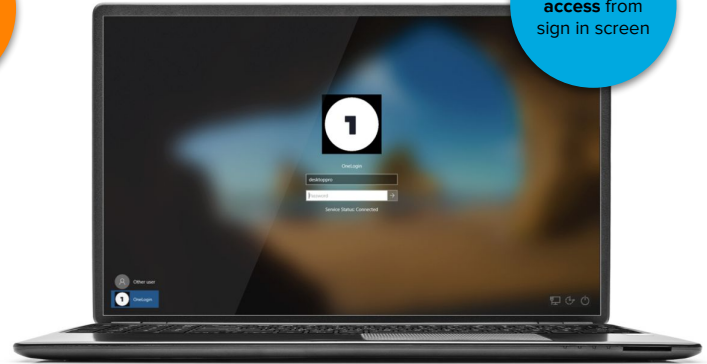

For locations where multiple workers share the same personal computer, OneLogin Desktop can operate as a kiosk that allows different users to securely sign into their OneLogin Portal from the same device.

What is OneLogin Desktop?

OneLogin Desktop

Login to your OneLogin portal without entering your credentials

OneLogin Desktop Pro

Adds login to your Mac or Windows computer using your OneLogin credentials

KEY CAPABILITIES

Strong authentication with OneLogin Desktop Certificate

OneLogin Desktop issues a unique certificate to each PC or Mac for strong authentication, which can be revoked by admins in case of a lost device.

MDM Deployment Support

Admin can securely deploy OneLogin Desktop to groups of PCs and Macs with 3rd party solutions such as Airwatch, JAMF, Meraki, etc.

Easy Management for IT

Easy device and security policy management, all in one place. Makes it easy and faster to onboard new employees and offboard former employees.

Device authentication

Users sign into their PC or Mac with their OneLogin password at boot time and on the lock screen.
